

CubeTech Web Development Intern Assessment

Project: Simple E-Commerce Website

Develop a simple and responsive e-commerce website with two separate interfaces:

1. Customer Website
2. Admin Dashboard

The system may use sample data, LocalStorage, Firebase, Supabase, or a simple backend.

A. Customer Website

1. Home Page

The home page must include:

- Store logo or store name
- Navigation menu
- Promotional banner
- Product categories
- Featured products
- Footer with contact information and social media links

2. Product Listing Page

Display at least 10 sample products.

Each product must show:

- Product image
- Product name
- Price
- Category
- Stock availability
- View Details button
- Add to Cart button

The page must include:

- Product search
- Category filter
- Price sorting

- Responsive product grid

3. Product Details Page

The page must include:

- Product image
- Product name
- Price
- Description
- Available stock
- Quantity selector
- Add to Cart button
- Related products

4. Shopping Cart

Customers must be able to:

- View selected products
- Update product quantity
- Remove products
- View subtotal
- View total amount
- Proceed to checkout

Cart information should remain available after refreshing the page.

5. Checkout Page

The checkout form must include:

- Customer Name
- Email Address
- Contact Number
- Delivery Address
- Payment Method
- Order Notes

Payment options may include:

- Cash on Delivery
- E-Wallet
- Bank Transfer

After checkout, display:

- Order confirmation message
- Generated order number
- Order summary

No real payment gateway is required.

B. Admin Dashboard

1. Admin Login

Create a simple login page for the administrator.

Sample login credentials may be included in the README file.

Authentication may be simulated for the assessment.

2. Dashboard Overview

Display summary cards for:

- Total Products
- Total Orders
- Pending Orders
- Completed Orders
- Total Customers
- Total Sales

A simple sales or order chart is optional.

3. Product Management

The administrator must be able to:

- View products
- Add a product
- Edit a product
- Delete a product
- Search products
- Filter products by category or status

Product fields must include:

- Product Name
- Product Image
- Category
- Description
- Price
- Stock Quantity
- Product Status

Product statuses:

- Active
- Inactive
- Out of Stock

Display a confirmation message before deleting a product.

4. Category Management

The administrator must be able to:

- View categories
- Add a category
- Edit a category
- Delete a category

Prevent deletion when the category is currently assigned to a product, or display a warning message.

5. Order Management

Display an order table containing:

- Order Number
- Customer Name
- Order Date
- Total Amount
- Payment Method
- Order Status
- View Details button

Order statuses:

- Pending
- Confirmed
- Preparing
- Shipped

- Completed
- Cancelled

The administrator must be able to update the order status.

6. Order Details

The order details page must show:

- Order number
- Customer information
- Delivery address
- Ordered products
- Product quantities
- Subtotal
- Total amount
- Payment method
- Order status
- Order notes

7. Customer Management

Display a list of customers with:

- Customer Name
- Email Address
- Contact Number
- Number of Orders
- Total Purchase Amount
- Account Status

A detailed customer profile is optional.

Required System Behavior

Changes made on the admin page should appear on the customer page.

Examples:

- A newly added product should appear in the customer product listing.
 - An inactive product should not appear on the customer page.
 - Updated product prices should reflect on the customer page.
 - Customer orders should appear in the admin order list.
 - Updated order statuses should appear in the customer order summary, when implemented.
-

Technical Requirements

Applicants may use:

- HTML, CSS, and JavaScript
- React
- Vue
- Next.js
- Laravel
- Node.js
- Bootstrap
- Tailwind CSS
- Firebase
- Supabase
- MySQL
- LocalStorage or sample JSON data

A real payment gateway is not required.

The website must be:

- Responsive on desktop and mobile
- User-friendly
- Properly validated
- Organized using reusable components
- Free from major console errors
- Easy to install and run

Submission Requirements

Applicants must submit:

- GitHub repository link
 - Live customer website link
 - Live admin dashboard link
 - README file with setup instructions
 - Admin login credentials
 - Technologies used
 - Desktop and mobile screenshots
 - Short explanation of the system flow
-

Recommended Completion Period

Applicants should complete the task within 3 to 5 days.

They do not need to build a production-ready system. The assessment focuses on coding quality, design, functionality, and problem-solving.

Evaluation Criteria

- Customer Page Functionality — 20%
 - Admin Dashboard Functionality — 25%
 - UI and User Experience — 15%
 - Code Quality and Organization — 15%
 - Mobile Responsiveness — 10%
 - Data Integration and System Flow — 10%
 - Documentation — 5%
-

Optional Bonus Features

Applicants may add:

- Product image upload
- Discount codes
- Wishlist
- Customer login and registration
- Order tracking
- Sales charts
- Low-stock alerts
- Export orders to CSV
- Pagination
- Dark mode
- Role-based admin access
- Email order confirmation
- Loading indicators and skeleton screens

AI tools may be used for assistance, but applicants must understand their code and be able to explain the system during the interview.
